Aneuploidy, the gain or loss of chromosomes or chromosomal segments, is the hallmark of cancer. Conventional cytogenetic analysis studies the structural aberrations such as translocations, inversions and deletions. Recent observations from studies in yeast and humans indicate that low levels of aneuploidy may be of considerable significance in oncogenesis. Aneuploidy provides tumor cells with a further survival and/or growth advantage. Furthermore, aneuploidy has been shown to be associated with tumor relapse. Based on the discovery that some aneuploidies are inherent features of the cell, it has been suggested that tumor cells can be formed by minimal aneuploidy. In this review, we will discuss how the identification of cancer-specific aneuploidies contributes to elucidate the mechanisms of tumorigenesis.Asterolongic acid as a potential inhibitor of cancer cell proliferation by targeting the mTOR signaling pathway. Linoleyl ceramide is one of the long-chain fatty acid ceramides that can induce apoptosis in cancer cells. This study aimed to determine the inhibitory effects of long-chain ceramides on the proliferation of MCF-7, HepG2 and Caco-2 cells. Q: node js application directory and node I was doing some work on Node.js today. I just discovered that nodejs requires a node application folder. If I install Node.js on my system, then I have already the folder node.exe (and nodejs files), but there is no application folder. Then I tried to create it manually. I created it with the command mkdir -p node_app, and I have the application folder node_app created. Then I created a.js file in this directory, and I start the application in this way: var app = require("app"); var port = parseInt(process.argv[2], 10) || 8080; app.listen(port, function () { console.log("Server is running at
