Q: Why does the node.js Buffer constructor return a Readable stream? Why is node.js's Buffer constructor returning a Readable stream? I'm trying to stream some large arrays of numbers, and when I call stream.push on one of the buffers, I don't get a readable event, I get the events for the first record in the array. var buf = new Buffer([1,2,3,4,5,6,7,8,9,10]); var stream = new Stream(); stream.push(buf); stream.on("readable", function() { console.log("readable event!"); }); stream.on("data", function(data) { console.log("data event!"); }); stream.on("end", function() { console.log("end event!"); }); stream.on("close", function() { console.log("close event!"); }); stream.on("drain", function() { console.log("drain event!"); }); Is this correct behaviour or am I doing something wrong? A: The docs for the constructor say the following: If a string is given to the constructor, it will return a Buffer containing the given string. And so, by using new Buffer(string), you are creating a Buffer object containing a string. But since the constructor takes an array of numbers, this is how it returns. The stream interface is a Readable, which has a writable part that you can use to write the data you want.
