Developer API – The Application Programming Interface (API) is a set of functions and classes that developers can use to write programs for AutoCAD. The API is based on ObjectARX, and supports a wide range of programming languages including: Visual Basic, Visual C++, Visual Basic.NET, Delphi, C++Builder, ActionScript, AutoLISP, AutoCAD LT, AutoLISP, C#, Java, and JavaScript. The API is available to external developers who can build products to extend AutoCAD's functionality. Modelling tools Like other CAD products, AutoCAD uses modelling tools to create geometry and design information. These include: Drafting – The Drafting Application, provided with AutoCAD, is an interface for users to sketch and design objects. The drawing is based on a command line interface (CLI) and data model. The Drafting application allows users to draw objects such as circles, lines and arcs. Users can also insert text boxes, labels, and annotations. These annotations may be linked to a command in the command line interface to control the object's location, properties, or dimensions. Users can also draw and edit complex shapes such as surfaces and solids. Geometry – When a command is run, the geometry editor will read the geometry definition of the current drawing or model. The geometry editor will use this geometry definition to convert objects in the drawing or model into geometric entities (i.e. points, lines, arcs and surfaces). The geometry editor displays all the components (e.g. faces, edges and vertices) of the geometric entity. Drafting plugins – AutoCAD has multiple Drafting plugins to support construction projects: DrEdit – DrEdit is a web-based tool for design and engineering. Mesh-based visualisation AutoCAD supports many mesh-based visualisation techniques. These include: Surface visualisation – Users can visualise a surface in different ways. For example, the surface can be visualised in wireframe, solid, or hidden mode. Volume visualisation – Users can visualise a volume in different ways. For example, the volume can be visualised with a cross-section, top-down or different views. Subdivisions – Users can create subdivisions in the model. Weight paint – Users can assign a weight to surfaces to create a more realistic model. Extensions Notable extensions include: AutoCAD Architecture: Extends AutoC af5dca3d97

"Save our community garden" and "Save our Oak Park Garden" are the names of the page, which was created a few days ago. The page's creator said that the group is attempting to contact Alderman John Arena (45th) in an effort to stop a plan to develop land in the neighborhood where the garden is located. The man's identity was not revealed and the alderman's office was not immediately available for comment Monday evening. Some members of the community garden group, which was formed last year, said that the land near the University of Illinois at Chicago has been identified as a potential future site for a commercial development. The 13-acre property at 3200 N. Oak Park Ave. is currently zoned as a community garden, but it has the potential for residential development. It was previously used by the Chicago High School for Agricultural Sciences, but the school has since relocated to another location. The Facebook group said that the development plan is being discussed at a recent meeting of the alderman's zoning advisory committee and that it would destroy the community garden and the planned 4,000-square-foot building that is part of the garden. Alderman John Arena and the alderman's chief of staff Owen Brugh said at a Jan. 24 meeting of the committee that they received a letter from a land developer who expressed interest in the property. "I've never heard of this before," Arena said. Arena and Brugh told the committee members that the letter did not indicate whether the developer intended to develop the property as a community garden or a commercial site. The Facebook group said that the developer is seeking to develop the property as a mixed use of retail and residential.
