Test Assembly: When you design a new product, youll usually have many layers of test. The free version of OrCAD allows you to use paper test assemblies to test whether a new design will work in the field. Electronic Reference Library: When you design new PCBs for electronic products, youll often need to check the properties of the components to ensure that they meet your design criteria. The free version of OrCAD includes a library of reference models that you can use to quickly check component properties. Executable File Creation: Creating a complete design for an electronic product has more steps than creating a design for a mechanical product. The core of the design process for electronic products is creating the PCB and enclosure. The free version of OrCAD allows you to create an executable file so you can finish the design of your PC. VST support is a separate option that is available when working with the MathWorks VST plug-in for OrCAD. With the support available for this new VST plug-in, you can now design your PCBs with a completely new third-party VST Audio I/O and your existing audio plug-ins. Model Runtime Assist is a new feature in OrCAD that automatically analyzes your CAD design models to determine whether it is ready for manufacture. The Model Runtime Assist feature lets users know immediately if a design is not ready for manufacture, and provides early feedback when there are issues. One of the world experts in the design of PCBA and development of manufacturing automation systems, Amir Mousavi is the developer and creator of OrCAD. The previous version of OrCAD was not prepared for CAD design teams like PCB Assembly Design. Since the previous version could not meet such standards, it was impossible to create a professional quality design with the previous version.
