When you have the download file for Adobe Photoshop, you need to open it with your antivirus software. If you don't have an antivirus software installed, you should download one because it's a very important tool that can help you protect your computer from any viruses. You can get anti-virus software on the Internet or at your local store. Once the antivirus program is installed, you need to open the file and run the installer. Once the software is complete, you need to locate the installation.exe file and run it. After the installation is complete, you should have a fully functional version of Adobe Photoshop. To make sure that the software is working properly, you should check the version number to ensure that the crack was successful. And that's it! You have now successfully installed Adobe Photoshop.

A good start. After upgrading to CS6, Lightroom has been running great. Now, it looks like there are some bugs in the Reader/Refresh Processing plugin, and that many resources don't fully load for updating. As such, I decided to give Lightroom 5 a try for the first time (also updated one of my external drives to 5.5). Love the photo browser now -- it's so much faster and easier to navigate. I still believe the most powerful feature in Lightroom is NVIDIA(R) GPU(TM) acceleration, and in this version it's still greatly improved. Lightroom for Windows still hit 1GB in memory usage for the first time. Adobe has also greatly improved the import and speed of using Lightroom. Now, I am all Lightroom. Let's get started. Just to clear things up, in Lightroom 5 Adobe added the ability to choose from a variety of settings (like text size) for import, rather than having to choose a preset that you dislike later (like 150% or in Lightroom's case, the standard size). However, this did not fix the "slow" import speed that I still see when I scrape the memory usage. Lightroom 5's refresh feature is great, and I recommend trying it out. You can also drag and drop images directly into categories in the import window which can be very useful sometimes. The auto white balance does a very good job. I'm still not sure that I like the "stickers" selection from Lightroom 5, but I will keep experimenting with it. Lightroom doesn't need Adobe Portfolio (I still use it, even with Lightroom). I updated and I still like the way Lightroom works and know it will be even more so after Lightroom 4's "enhancements" like the "optical flow" feature and direct bookmarks are added. However, from an end user's perspective, there are some major changes that they are now also making in Lightroom that I don't like. For example, Adobe recommends exporting your files "as a web-ready file in Photoshop" (which in other words means, "support only formats that are packed in a ".psd" container"). I have a royaltyized product (AMACS) and the recommendation is not to export files at all. If users need their files to be more portable, then it should just be easier for them to use a higher resolution/format that is a better choice than the ones for web that Adobe used to recommend. I do like the video exporting function, but it would be better if it was self-contained and not an addon to Photoshop

The original image is referred to as the background layer. The other layers that you add over the background layer are called the foreground layers. Any layers that you add i.e. the shapes, text, textures, filters, gradients, patterns, etc. are referred to as foreground layers. The layers that are added above the original image are called the above layers. These are visible layers.
